

Regional overview:

EMEA's strengths and weaknesses and the financial impact of weak API security

The three EMEA markets in our study present a mixed picture on API security. On the upside, many organizations across the region have increased their focus on API security and have assigned responsibility for it. However, incident frequency and cost are still high, and too many firms still lack the detailed API inventories and testing regimes needed to secure their estates.

Q: Did your organization experience any API security incidents in the past 12 months?

Awareness of API risks is growing. Across the three markets, nearly two-thirds of respondents (62%) report a greater focus on securing APIs, led by the UK (70%). This prioritization of API security reflects the larger role APIs now play across the business. They underpin digital services, connect internal systems, and support a growing share of customer-facing, automated, and AI-enabled applications.
